FACULTY FOR COMPUTER SCIENCE, ELECTRICAL ENGINEERING AND MATHEMATICS
DEPARTMENT OF COMPUTER SCIENCE

MODULE HANDBOOK
MASTER PROGRAM COMPUTER SCIENCE v3 (IMA v3), ENGLISH

DATE: 26. SEPTEMBER 2022

Inhaltsverzeichnis

1	Preamble and Notes	3
2	Pflichtmodule	4
3	Wahlpflichtmodule	14
4	Focus Areas	131
4.1	Algorithm Design	131
4.2	Computer Systems	132
4.3	Data Science	132
4.4	Intelligence and Data	133
4.5	Networks and Communication	134
4.6	Security	135
4.7	Software Engineering	135
5	Modules in Winter Semester	137
6	Modules in Summer Semester	138
7	Modules in English	139

1 Preamble and Notes

For technical reasons, the preamble of the module handbook is maintained separately. It can be found under Module handbook computer science on the pages of the study program of the Institute of Computer Science. We kindly ask you to read this preamble. If you have any questions regarding this preamble, please contact the Computer Science Academic Advising.

Please also note that

1. this module handbook lists all modules provided for in the examination regulations, even if they are not offered in the corresponding semester.
2. this module handbook contains the data available at the time of writing. All information is without liability.

2 Pflichtmodule

Master-Abschlussarbeit						
Master Thesis						
Module number:	Workload (h): 900	Credits: 30	Regular Cycle: summer- / winter term			
	Semester number: 4. Semester	Duration (in sem.): 1	Teaching Language: de / en			
1	Module structure:					
	Course	form of teaching	contact-time (h)	self-study (h)	status (C/CE)	group size (TN)
	a) Master Thesis – Work Plan		30	120	C	1
	b) Master Thesis		30	720	C	1
2	Options within the module: none					
3	Admission requirements: Module examinations in the major subject of at least 48 credits must have been successfully completed. At least three modules in the specialization area must be successfully completed.					
4	Contents: <i>Contents of the course Master-Abschlussarbeit – Arbeitsplan:</i> After having agreed on a topic, the student draws up a work plan. The work plan includes the targeted results, the techniques and methods used and important milestones. <i>Contents of the course Master-Abschlussarbeit:</i> The Master Thesis consists of working on a demanding subject, including a written report and an oral presentation. With the thesis the student shows her/his ability to work independently and systematically on a demanding topic which also includes developing her/his own ideas. On a state-of-the-art basis the methods of computer science should be applied systematically. Topics for master theses are published regularly on the webpages of the research groups in the Department for Computer Science.					

2 Pflichtmodule

5	<p>Learning outcomes and competences:</p> <p>Finishing their master thesis students show that they are able</p> <ul style="list-style-type: none"> • to solve a problem in computer science within an appropriate time frame using scientifically sound Methode • to apply the techniques and methods that they learned during their studies to a new and demanding problem. <p>Non-cognitive Skills:</p> <ul style="list-style-type: none"> • Commitment • Learning competence • Learning motivation • Motivation • Literacy (scientific) • Self-monitoring 								
6	<p>Assessments:</p> <p><input checked="" type="checkbox"/>Final module exam (MAP) <input type="checkbox"/>Module exam (MP) <input type="checkbox"/>Partial module exams (MTP)</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">zu</th> <th style="text-align: center;">Type of examination</th> <th style="text-align: center;">Duration or scope</th> <th style="text-align: center;">Weighting for the module grade</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">a) - b)</td> <td style="text-align: center;">Thesis</td> <td style="text-align: center;">30-120 pages</td> <td style="text-align: center;">100%</td> </tr> </tbody> </table>	zu	Type of examination	Duration or scope	Weighting for the module grade	a) - b)	Thesis	30-120 pages	100%
zu	Type of examination	Duration or scope	Weighting for the module grade						
a) - b)	Thesis	30-120 pages	100%						
7	<p>Study Achievement:</p> <p>none</p>								
8	<p>Prerequisites for participation in examinations:</p> <p>none</p>								
9	<p>Prerequisites for assigning credits:</p> <p>The credit points are awarded after the module examination was passed.</p>								
10	<p>Weighing for overall grade:</p> <p>The module is weighted with 50 credits.</p>								
11	<p>Reuse in degree courses:</p> <p>keine</p>								
12	<p>Module coordinator:</p> <p>Studiengangsbeauftragter Informatik</p>								

2 Pflichtmodule

13	<p>Other Notes:</p> <p>The master's thesis is an examination paper that concludes the scientific education and is intended to show that the candidate has the ability to work on a problem in computer science according to scientific methods within a certain period of time. The assignment should be designed to be equivalent to five months of full-time work. The thesis must be submitted five months after having been issued. As a rule, the thesis should not exceed 120 DIN A4 pages.</p> <p><i>Remarks of course Master-Abschlussarbeit – Arbeitsplan:</i></p> <p>Implementation method In agreement with supervisor.</p> <p>Learning Material, Literature Depending on the topic.</p> <p><i>Remarks of course Master-Abschlussarbeit:</i></p> <p>Implementation method Independent studies supported by individual advice and supervision</p> <p>Learning Material, Literature Depending on the thesis topic.</p>

	a) Project Group	PG	240	360	C	15
2	Options within the module:					
	none					
3	Admission requirements:					
	<i>Prerequisites of course Projektgruppe:</i>					
	Recommended Proficiencies					
	Depending on the topic.					

2 Pflichtmodule

4	<p>Contents:</p> <p><i>Contents of the course Projektgruppe:</i></p> <p>In a project group a group of usually 8-16 students works together over a period of one year (two semesters) on a research topic determined by the group organizer. Project groups introduce students to current research topics that are usually related to the group organizer's special area of interest and the team working of the project group should be a preparation for industrial practice. Topics of project groups cover the whole range of research interests of the research groups in the Department of Computer Science.</p>								
5	<p>Learning outcomes and competences:</p> <p>In project groups, participating students gain first-hand practical experience in working in a team and organizing a project; in doing so, they become prepared for daily work in their later professions. The students personally experience how to carry out extensive development processes in a team. Since the tasks are divided among the individual team members, the participating students become skilled in reporting their progress and research findings to the other group members.</p> <p>Non-cognitive Skills</p> <ul style="list-style-type: none"> • Commitment • Team work • Learning competence • Learning motivation • Motivation • Literacy (scientific) • Self-monitoring 								
6	<p>Assessments:</p> <p><input checked="" type="checkbox"/>Final module exam (MAP) <input type="checkbox"/>Module exam (MP) <input type="checkbox"/>Partial module exams (MTP)</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">zu</th> <th style="text-align: center;">Type of examination</th> <th style="text-align: center;">Duration or scope</th> <th style="text-align: center;">Weighting for the module grade</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">a)</td> <td>Partial Module Exam</td> <td></td> <td style="text-align: center;">100%</td> </tr> </tbody> </table> <p>In the Project Group module, the successful completion of projects must be demonstrated by submitting software and documentation as a phase-related examination. A grade is awarded for the entirety of the projects worked on. The responsible lecturer announces type and duration of assessment modalities in the first three weeks of the lecture period at latest.</p>	zu	Type of examination	Duration or scope	Weighting for the module grade	a)	Partial Module Exam		100%

2 Pflichtmodule

3	<p>Admission requirements:</p> <p><i>Prerequisites of course Seminar:</i></p> <p>Recommended Proficiencies Depending on the seminar topic.</p>								
4	<p>Contents:</p> <p><i>Contents of the course Seminar:</i></p> <p>In seminars, students work independently on an individual research topic by using background literature from various sources. They describe their research topic in a presentation followed by discussion and a written report. The presentation material and the written report serve two different purposes: Whereas the presentation material supports the lectures (held within a specific time period), the written report provides students the opportunity to acquire detailed information on the reported topic at a later date.</p> <p>Seminars usually consist of 8 to 15 related subtopics, each of which is researched by one participating students. Seminar topics cover the whole spectrum of research topics of the research groups in the Department of Computer Science.</p>								
5	<p>Learning outcomes and competences:</p> <p>In seminars, students learn the techniques for independent research work on non-trivial topics and how to present these topics in a presentation and in written form. The seminar participants are encouraged to familiarize themselves with a research-oriented subfield of computer science. They learn how to plan a presentation and hold it within the determined time frame (usually 45 to 60 minutes), and to prioritize the contents of the presentation. The participants experience how an audience obtains knowledge from a presentation, and how to exchange opinions and information in discussions. Seminars also teach rhetorical skills for presentations and discussions. Participating students learn how to structure a presentation according to its contents and how to use various means to illustrate complex issues. They also learn how to handle the background literature appropriately.</p> <p>Non-cognitive Skills</p> <ul style="list-style-type: none"> • Commitment • Cooperation • Learning competence • Media competence • Motivation • Literacy (scientific) • Self-monitoring 								
6	<p>Assessments:</p> <p> <input checked="" type="checkbox"/> Final module exam (MAP) <input type="checkbox"/> Module exam (MP) <input type="checkbox"/> Partial module exams (MTP) </p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th style="width: 10%; text-align: center;">zu</th> <th style="width: 45%; text-align: center;">Type of examination</th> <th style="width: 20%; text-align: center;">Duration or scope</th> <th style="width: 25%; text-align: center;">Weighting for the module grade</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">a)</td> <td>Presentation and seminar paper</td> <td style="text-align: center;">45-60 minutes, 15-30 pages</td> <td style="text-align: center;">100%</td> </tr> </tbody> </table> <p>The responsible lecturer announces type and duration of assessment modalities in the first three weeks of the lecture period at latest.</p>	zu	Type of examination	Duration or scope	Weighting for the module grade	a)	Presentation and seminar paper	45-60 minutes, 15-30 pages	100%

	<i>Prerequisites of course Advanced Complexity Theory:</i>						
	Recommended Proficiencies						
	Basic knowledge about complexity theory (e.g., Turing machines, NP-completeness)						

3 Wahlpflichtmodule

4	<p>Contents:</p> <p><i>Contents of the course Advanced Complexity Theory:</i></p> <p>Complexity Theory deals with determining the amount of resources (e.g. runtime, memory consumption) necessary and sufficient for solving a given algorithmic problem (e.g. Travelling Salesperson Problem (TSP)) on a given machine model (e.g. Turing machine). One approach is to define complexity classes like P, NP, PSPACE, in order to classify problem complexity by means of completeness in such classes, like the famous class of NP-complete problems. This gives conditional results like “If NP is not equal P, then TSP is not solvable in polynomial time.” This branch of Complexity Theory is often referred to as Structural Complexity Theory. In contrast, proving explicit lower bounds for given problems is the topic of the so-called Concrete Complexity Theory. As nobody is currently able to prove superlinear time bounds for explicitly defined problems on general computation models like Turing machines, one considers somewhat restricted models like 1-tape Turing machines, monotone Boolean circuits, Boolean circuits with bounded depth, algebraic computation models, and several kinds of parallel computation models. This lecture surveys approaches to prove such lower bound on various such models.</p> <ul style="list-style-type: none"> • Deterministic, non-deterministic and probabilistic time and space complexity classes, hierarchies, completeness • Lower bounds for size and depth of different variants of Boolean circuits • Lower bounds for algebraic computations 								
5	<p>Learning outcomes and competences:</p> <p>The students get to know fundamental techniques in the area of complexity theory. 4	<p>Contents:</p> <p><i>Contents of the course Architektur paralleler Rechnersysteme:</i></p> <p>The lecture considers computer architectures of actual parallel computer systems and the usage of this systems. The focus of the lecture is on high-performance computers (supercomputers).</p> <ul style="list-style-type: none">• Users' view on Parallel Computers• Programming of Parallel Computers• Principles of Computer Architecture• Overview of actual Parallel Computer Systems• Shared Memory Systems• Cache Coherency of Scalabel Computer Systems• High Performance Interconnects• Datacenter Architectures• Energy Efficiency
5	<p>Learning outcomes and competences:</p> <ul style="list-style-type: none">• Students name and explain programming paradigms of parallel programming languages. They master basic constructions of the languages and library functions of the most important parallel programming languages and environments (e.g. OpenMP, POSIX-Threads, MPI, PGAS) and name the areas of applications.• Students are able to describe the features of actual HPC systems and processors. They describe major underlying trends (power wall, Memory wall, ILP wall) of the systems.• Students name and describe General used classifications of parallel systems. They describe the important structure elements of Operation principles of parallel computer systems. They master the theoretical behavior of scaling (Amdahl, Gustafson) and quantitative Evaluations of parallel computers.• Students name and describe architectural characteristics of scalable shared memory systems. They master different techniques to maintain memory consistency and coherency in bus based systems (Invalidation protocols, update protocols). They describe technics to increase the Performance of These systems (Multi Level caches, transient states, split Transaction busses).• Students describe mechanisms to establish synchronizations (locks, barriers) in parallel systems.• Students demonstrate knowledge and understanding of in maintaining cache coherency within scalable computer systems (hierarchical snooping, directories). They master techniques to increase the performance of these systems (e.g. latency, throughput).• Students describe techniques based on token coherency.• Students name and describe fundamental features of the architectures of cluster systems. They are able to describe the topology of communication systems and metrics for evaluation (e.g. degree, diameter, bisection). They master communication techniques of high performance interconnect networks (e.g. wormhole Routing, virtual cut-through). They master techniques to proof are deadlock are avoided.• Students describe features of existing interconnects (InfiniBand, OmniPath). <p>Non-cognitive Skills</p> <ul style="list-style-type: none">• Commitment• Learning competence

4	Contents: In this module, varying courses are offered, for example by guest lecturers. For specific contents see the course descriptions. <i>Contents of the course Software Engineering for Self-Adaptive Systems:</i> The complexity of software systems, the evolution of requirements, and the uncertainty of requirements and environments challenge the management of running systems. One promising solution are self-adaptive systems, that is, systems that are able to adapt their behavior in response to changing and uncertain requirements and environments. In this lecture we will discuss the foundations as well as methods and techniques to engineer and assure self-adaptive systems. The focus will be on the software engineering aspects and how self-adaptation impacts typical software engineering activities. A selection of methods and techniques will be exemplified on research prototypes (so-called exemplars) in the tutorials and project. <i>Contents of the course Privacy Enhancing Technologies:</i> This course provides students with a basic understanding of privacy risks, the most common technologies for addressing them ("PETS"), and the human factors that shape their design.

Build It, Break It, Fix It						
Build It, Break It, Fix It						
Module number: M.079.4013	Workload (h): 180	Credits: 6	Regular Cycle: summer term			
	Semester number:	Duration (in sem.): 1	Teaching Language: en			
1	Module structure:					
	Course	form of teaching	contact-time (h)	self-study (h)	status (C/CE)	group size (TN)
	a) L.079.05713 Build It, Break It, Fix It	L3 Ex2	75	105	CE	20
2	Options within the module: none					

3 Wahlpflichtmodule

3	<p>Admission requirements:</p> <p><i>Prerequisites of course Build It, Break It, Fix It:</i></p> <p>Recommended Proficiencies</p> <ul style="list-style-type: none">• Being able and willing to get into new topics independently is mandatory.• Mature coding skills in at least one popular programming language (Java, Python, C, C++) is mandatory.• Knowledge about software security requirements, secure software development practices and cryptography as well as experience in the field of software exploitation and vulnerability discovery will be helpful.
4	<p>Contents:</p> <p><i>Contents of the course Build It, Break It, Fix It:</i></p> <p>This course aims at teaching basic principles of secure software development in a very practical fashion. It is based on the “Break It, Build It, Fix It” security contest by Ruef et al. The contest is separated into three phases that test the applicant’s skills in the fields of building, breaking and fixing software products.</p> <p>In the “Build It” phase, students will be asked to gather in teams and develop small software projects based on a formal specification, also including security requirements. In the “Break It” phase, the developed software will be exchanged between development teams to break the implementation, i.e., find and exploit security vulnerabilities in code of other teams. Afterward, in the “Fix It” phase, teams will get the chance to fix found vulnerabilities and, hence, render their software product more secure.</p> <p>The course will contain a theoretical part in which basic strategies of secure software development and vulnerability discovery are presented. Furthermore, specific vulnerability classes and examples of their exploitation will be presented as stimulus at the beginning of the “Break It” phase. Nevertheless, the course is generally of a very practical nature and since securing a software product, as well as breaking it, demands a wide variety of skills and creativity, a high amount of motivation and self-organization is required.</p>
5	<p>Learning outcomes and competences:</p> <p>After having attended this course, students will have. . .</p> <ul style="list-style-type: none">• gained knowledge and experience in the field of secure software development• gained knowledge and experience in the field of software exploitation as well as vulnerability discovery• learned common real world software vulnerabilities and ways of exploiting them <p>Non-cognitive Skills</p> <ul style="list-style-type: none">• Commitment• Cooperation• Learning competence• Self-monitoring

2	Options within the module: none						
3	Admission requirements: <i>Prerequisites of course Clustering Algorithms:</i> Recommended Proficiencies Algorithms and data structures, linear algebra, probability theory						
4	Contents: <i>Contents of the course Clustering Algorithms:</i> We study an important tool to analyze data: clustering. Clustering is the process of dividing data into useful or sensible groups. A sensible division should resemble the data's natural structure. Sometimes the goal is that each cluster should contain as many items of a similar kind as possible (for example in data compression). Clustering is a very natural way to analyze and structure data. Especially in natural sciences we are working with data whose structure is unknown to us. An example is the human DNA, that humankind is trying to decode. Clustering can be a very powerful tool in such cases. We re view standard techniques for clustering like Lloyd's algorithm and agglomerative clustering. We also look at extensions and generalizations of clusterings like estimating model parameters. <ul style="list-style-type: none"> • Agglomerative clustering • K-Means clustering • Geometric clustering: DBSCAN • Dimension reduction: Johnson-Littlewood and SVD • Mixture Models and EM algorithm 						
5	Learning outcomes and competences: Students know the main clustering algorithms. Depending on the problem at hand they can decide which algorithm is most appropriate. They can adapt algorithms to new situations. Students know various methods for modeling clustering problems. They can apply and adapt the methods. Depending on the modeling, they can choose appropriate algorithms and assess their quality. Non-cognitive Skills <ul style="list-style-type: none"> • Learning competence • Literacy (scientific) • Self-monitoring

2	Options within the module: none					
3	Admission requirements: <i>Prerequisites of course Computational Argumentation:</i> Recommended Proficiencies Syllabus of the bachelor course “Introduction to Text Mining” and/or the master course “Statistical Natural Language Processing”. Alternatively, the contents of the lectures “Data Mining” (bachelor), “Machine Learning I”, and “Information Retrieval” (both master) are helpful. Basics of statistics.					
4	Contents: <i>Contents of the course Computational Argumentation:</i> Argumentation is an integral part of both professional and everyday communication. Whenever a topic or question is subject to controversy, people consider arguments to form opinions, to make decisions, or to convince others of a certain stance. In the last years, the computational analysis and synthesis of natural language argumentation has become an emerging research area, due to its importance for the next generation of web search engines and intelligent personal assistance. Based on fundamental techniques from natural language processing, computational argumentation ranges from the mining of arguments from natural language text, over the assessment of argumentation quality, to the retrieval of arguments in web search.					
5	Learning outcomes and competences: The students learn both fundamentals from argumentation theory and state-of-the-art techniques from computational argumentation. The use of respective methods is practiced in assignments. Non-cognitive Skills <ul style="list-style-type: none"> • Attitude • Self-monitoring

4	<p>Contents:</p> <p><i>Contents of the course Data Science in Industrial Applications:</i></p> <p>The increasing connectivity of machines, sensors and IT systems in context of Industry 4.0 has led to a rapid increase in available data volume. The analysis of data offers enormous potential for the automation of cognitive tasks, the optimization of processes and the further value creation from data.</p> <p>The lecture gives an overview of the challenges and approaches for the industrial application of Data Science. This includes the integration of industrial data sources at field level, the IT landscape in manufacturing companies and the setup of (Big Data) infrastructure, typical algorithms in the area of time series processing, optimization or image processing as well as the embedding in business processes.</p> <p>Theoretical and methodical foundations, concepts and tools are introduced during the lecture and applied based on a case study in workshops, team work, as well as in home exercises. Skills in team work and cooperation, self-control and project management are deepened.</p>								
5	<p>Learning outcomes and competences:</p> <p>Students understand the challenges of applying data science methods in industrial context and have an overview of typical use case examples. They are able to apply methods of signal processing, machine learning and statistics to industrial problems and plan the implementation of data acquisition, data architecture and integration into business processes.</p> <p>Non-cognitive Skills</p> <ul style="list-style-type: none"> • Team work • Cooperation • Learning competence

Foundations of Knowledge Graphs
Foundations of Knowledge Graphs

3 Wahlpflichtmodule

Module number: M.079.4054	Workload (h): 180	Credits: 6	Regular Cycle: winter term			
	Semester number:	Duration (in sem.): 1	Teaching Language: en			
1	Module structure:					
	Course	form of teaching	contact-time (h)	self-study (h)	status (C/CE)	group size (TN)
	a) L.079.05809 Foundations of Knowledge Graphs	L2 Ex3	75	105	CE	24
2	Options within the module: none					
3	Admission requirements: <i>Prerequisites of course Foundations of Knowledge Graphs:</i> Recommended Proficiencies Graph theory, logics					
4	Contents: <i>Contents of the course Foundations of Knowledge Graphs:</i> Knowledge graphs are used in an increasing number of applications. Large organisations such as Google Yahoo! and the BBC rely on these technologies to organise and manage the access to the the large amounts of data they manage. This lecture aims to present approaches for building, storing, integrating and using knowledge graphs. We will begin by studying knowledge extraction techniques for unstructured data. These include named entity recognition, disambiguation and relation extraction. Technologies for storing and knowledge (e.g., triple stores) will be presented subsequently. Time-efficient and accurate approaches for knowledge integration and link prediction will be followed by a series of applications for knowledge graphs. <ul style="list-style-type: none"> • Semantic networks • Property graphs • RDF graphs • Query languages (e.g., Cypher, SPARQL) • Knowledge extraction from text • Knowledge extraction from semi-structured data • Link discovery • Machine learning approaches for link discovery • Link prediction and tensor factorization 					

3 Wahlpflichtmodule

5	<p>Learning outcomes and competences:</p> <p>The students can carry out the following after the completion of the module:</p> <ul style="list-style-type: none"> • Model knowledge graphs; • Describe the formal semantics of modeling languages; • Create formal ontologies and check them for consistency; • Model efficient imperative and descriptive languages; • Train and execute knowledge extraction models, <p>Non-cognitive Skills</p> <ul style="list-style-type: none"> • Team work • Learning competence • Media competence • Literacy (scientific)

	Semester number:	Duration (in sem.):		Teaching Language:			
		1		en			
1	Module structure:						
	Course	form of teaching	contact-time (h)	self-study (h)	status (C/CE)	group size (TN)	
	a) L.079.05744 Game Theory	L3 Ex2	75	105	CE	25	
2	Options within the module:						
	none						
3	Admission requirements:						
	<i>Prerequisites of course Game Theory:</i>						
	Recommended Proficiencies						
	This course requires a general mathematical maturity. Calculus and probability. Combinatorics. A good understanding of mathematics, notions such as definition and proof, basic set theory, linearity, sufficiency, necessity, characterisations, etc.						

4	<p>Contents:</p> <p><i>Contents of the course Game Theory:</i></p> <p>The course introduces a person to non-cooperative and cooperative game theory. The students will receive a broad overview of the branches of game theory, and subsequently dive into non-cooperative solution concepts and efficiency measures. We consider several models and important classes of such games. The second part of the course deals with cooperative solution concepts and classes of games.</p> <p>Topics</p> <ul style="list-style-type: none"> • Game theory areas (non-cooperative, cooperative, MD (auctions, etc.), epistemic GT, evolutionary GT, logic in GT, etc.), Utility theory (Von-Neumann Morgenstern) and rationality assumption, Normative approach here (rather than descriptive), Non-cooperative game theory: Normal form games, Extensive games, Succinct representations (polymatrix games, graphical games, etc.), (In)Complete and (in)perfect information assumptions, (In)finite games • Normal (= strategic)-form games: (Pure) Nash equilibrium, Examples (of non-existence too), Efficiency (prices if anarchy and stability (PoA, PoS)), Strongly/weakly dominant strategies (1st and 2nd price) auctions example, Strongly/weakly dominated strategies, Elimination (order-dependent for weak and independent for strong), The influence of elimination on NE • (Exact) potential games, Equivalence to congestion games • Zero-sum games, (maxmin, minmax, value, exchangeability of NE strategies) • Mixed extension, Mixed NE, (Finite existence) • Properties of mixed NE, general (mixed dominance), symmetric games, constant-sum, potential, Finding mixed NE (general alg. and examples), Rationalizability • Social welfare, Prices of anarchy and stability, Examples (coordination, routing, etc.) • Correlated and coarse correlated equilibrium, Strong Nash equilibrium, Evolutionary equilibrium and evolutionary games • Extensive games, A winning strategy and proof techniques, Zermelo's algorithm, Examples: chess, checkers, chomp • SPE, Existence • (In)finitely repeated games (prisoner's dilemma, etc.), Folk theorems • Cooperative games: Non-transferable and transferable utility, General properties, Transferable utility: Simple games • Core, Bondareva-Shapley characterisation theorem • The Shapley value and its axiomatic characterisation
---	---

3 Wahlpflichtmodule

5	<p>Learning outcomes and competences:</p> <p>To define, understand and use the following:</p> <ul style="list-style-type: none"> • General areas of GT • Non-cooperative games • Normal(strategic) games • Nash equilibria, dominant strategies • Prices of anarchy and stability • Potential games • Congestion games • Constant-sum games • Mixed NE, existence and finding these equilibria • Rationalizability • Efficiency bounds • Correlated and coarse correlated NE • Strong NE • Evolutionary stable strategy • Extensive games • winning strategy • Zermelo algorithm • Subgame perfect equilibrium • Repeated games and folk theorems • Cooperative games • Transferable utility • Simple games • Core • Bondareva-Shapley theorem • The Shapley value and its axiomatic characterisation <p>Non-cognitive Skills</p> <ul style="list-style-type: none"> • Attitude • Learning competence • Literacy (scientific) • Self-monitoring

3	<p>Admission requirements:</p> <p><i>Prerequisites of course Kontextuelle Informatik:</i></p> <p>Recommended Proficiencies</p> <ul style="list-style-type: none">• Good general knowledge• Ability to read and analyze longer and complex texts from computer science as well as the humanities
4	<p>Contents:</p> <p><i>Contents of the course Kontextuelle Informatik:</i></p> <p>Computer scientists and programmers develop products based on symbolic descriptions (programs, specifications, documentation etc.) by modeling a specific domain. A number of different questions arise when such products are being developed: How can the developers adequately model the data that are to be processed as well as the processes that are to be implemented? Which consequences result from the possibility to develop interactive systems? When using the software, which role will the users play, which the software? Which underlying conditions of the usage context need to be considered?</p> <p>The lecture discusses the theoretical and conceptual foundations of computer science relevant to the further considerations. Special attention will be paid to differentiate between technical concepts and the sphere of usage. Against this background, theories of interactive systems will be explored in order to examine which role digital media play with respect to processes of the mind. When developing computer systems, relevant data and processes need to be anticipated to a certain degree and modeled as formal systems. This raises issues like the question under which conditions such a formal description can be made in an adequate way and with which consequences regarding the reliability and responsible use of computer systems in a given domain.</p> <ul style="list-style-type: none">• Basic concepts of computer science• Digital media and processes of the mind• Paradigms of replacement and support• Modeling and formalizing data and processes• Legal and ethical questions
5	<p>Learning outcomes and competences:</p> <p>Students will learn to examine the role of interactive systems based on theories. They will learn to distinguish between technical and non-technical problems and how to relate these to each other. They will be enabled to assess current technological trends and computer systems as well as the potentials of innovation in the field of digital media.</p> <p>Non-cognitive Skills</p> <ul style="list-style-type: none">• Social and ethical judgement• Attitude• Media competence• Literacy (scientific)

Logic Programming for Artificial Intelligence							
Logic Programming for Artificial Intelligence							
Module number: M.079.4031		Workload (h): 180		Credits: 6		Regular Cycle: summer- / winter term	
		Semester number:		Duration (in sem.): 1		Teaching Language: en	
1	Module structure:						
	Course	form of teaching	contact-time (h)	self-study (h)	status (C/CE)	group size (TN)	
	a) L.079.05808 Logic Programming for Artificial Intelligence	L3 Ex2	75	105	CE	40/20	
2	Options within the module: none						
3	Admission requirements: <i>Prerequisites of course Logic Programming for Artificial Intelligence:</i> Recommended Proficiencies Students should have previous knowledge in programming as offered in the courses "Programmierung" and "Programming Languages" and knowledge in database query languages as offered in the course "Database Systems".						
4	Contents: <i>Contents of the course Logic Programming for Artificial Intelligence:</i> This course views various concepts and techniques from computer science, artificial intelligence, and computational linguistics from a different perspective, i.e. the perspective of programming in logic. Programming in logic in general and the programming language Prolog in particular offer the ability to describe many concepts in logic, i.e. in a declarative way, and to have them tested and executed by an interpreter at a same time. This is in particular useful for puzzles and quizzes, but also for self-defined or domain specific languages. <ul style="list-style-type: none"> • Introduction into logic programming using the Prolog language • Constraint solvers, puzzles, and theorem provers • Interpreters for term substitution systems • Parsing programs, XML, and natural language • Semantics construction, question answering systems, and text translation • Meta interpreters, domain specific languages, and programming in "natural language" • Feature term unification and applications in computer linguistics and ecommerce

4	Contents: <i>Contents of the course Model-Based Systems Engineering:</i> The goal of the lecture is a comprehensive understanding of Model-Based Systems Engineering (MBSE) and its components. The students are taught the essential topics of MBSE. This includes fundamentals including languages, methods and IT tools, which are also tested in practice. The benefits of MBSE (an understanding of the system by all involved actors, a basis for communication and cooperation between different disciplines but also functional areas, . . .) will be conveyed to the students. Furthermore, essential analysis methods for testing system designs are covered. The focus is on multidisciplinary, software-intensive systems from the mechanical and plant engineering and automotive industries. <ul style="list-style-type: none"> • Basics of MBSE • SysML for multidisciplinary systems • CONSENS • further MBSE approaches • design patterns • MBSE Tools • analysis methods based on the system model

3 Wahlpflichtmodule

4	<p>Contents:</p> <p><i>Contents of the course Optimierungsverfahren für das maschinelle Lernen:</i></p> <p>Machine learning has become an important aspect in countless applications from various disciplines. The central aspect in machine learning is the <i>automated identification and exploitation of patterns</i> in data sets. In <i>supervised learning</i>, a method is parameterized in such a way that it can be applied to until now unknown data (for instance for the identification of objects within an image), i.e., that it <i>generalizes</i>.</p> <p>The determination of the underlying parameters is in most cases realized by solving an <i>optimization problem</i>: Determine the parameters such that the error on the <i>training data set</i> is minimized. Here, the type of optimization critically depends on the machine learning approach as well as on the training data.</p> <p>In this lecture, we cover the basics for the training of machine learning methods in depth. The covered topics are:</p> <ul style="list-style-type: none">• Regression methods• Nonlinear optimization• The training of deep neural networks• Stochastic gradient methods• Multiobjective optimization approaches for machine learning
5	<p>Learning outcomes and competences:</p> <p>Students learn</p> <ul style="list-style-type: none">• factual knowledge about<ul style="list-style-type: none">– the basis of various optimization methods– the specifics of using optimization methods in the context of machine learning– the required steps for training neural networks– the limitations of training machine learning methods• methodological knowledge, including<ul style="list-style-type: none">– the configuration and implementation as well as the training of neural networks– the treatment of large data sets• transfer skills<ul style="list-style-type: none">– the application of the learned methods to learning methods and neural network architectures– the selection of machine learning methods that are suitable for the available data• normative evaluation skills including the ability to assess<ul style="list-style-type: none">– the suitability of specific methods in terms of the available amount of data, the system complexity, etc.– the limitations and reliability of machine learning methods <p>Non-cognitive Skills</p> <ul style="list-style-type: none">• learning competence• learning motivation

3	Admission requirements:						
	<i>Prerequisites of course Planning and Heuristic Search:</i>						
	Recommended Proficiencies						
	Basics of symbolic modeling: functions, relations, logical formulas; design and analysis of algorithms; basics of computational complexity theory: complexity classes, reducibility, completeness.						
4	Contents:						
	<i>Contents of the course Planning and Heuristic Search:</i>						
	The course "Planning and Heuristic Search" introduces two approaches to solve knowledge-intensive tasks. In the "Planning" part, domain tasks are represented as planning problems using e.g. state spaces or plan spaces. Several approaches to planning are discussed and analyzed. The "Heuristic Search" part generalizes the state space concept and introduces a general framework of systematic search algorithms that are guided by heuristic information on the problem domain. As an application example, planning algorithms can be implemented deterministically using heuristic search. Theoretical results will be presented and proved in both areas.						
	Part Planning

1	Module structure:						
	Course	form of teaching	contact-time (h)	self-study (h)	status (C/CE)	group size (TN)	
	a) L.079.05806 Routing and Data Management in Networks	L3 Ex2	75	105	CE	40/20	
2	Options within the module: none						
3	Admission requirements: <i>Prerequisites of course Routing and Data Management in Networks:</i> Recommended Proficiencies Algorithm design, theoretical correctness and efficiency proofs, tools from combinatorics and probability theory.						
4	Contents: <i>Contents of the course Routing and Data Management in Networks:</i> Routing and data management are fundamental tasks to be solved in order to ensure efficient use of large networks, e.g. the Internet, peer-to-peer systems, or wireless mobile ad-hoc networks. This lecture deals with algorithms and their analysis for routing and data management in such systems and describes, in particular, methods for dealing with their dynamics (movement of nodes, joining and exiting nodes). In particular, local, distributed algorithms, often as online algorithms, are considered. <ul style="list-style-type: none"> • Offline and online routing strategies • Scheduling strategies • Data management strategies 						
5	Learning outcomes and competences: The students get to know fundamental techniques in the area of routing and data management of large networks. They can decide in which situation which data management, scheduling, or routing algorithm is most appropriate. They can adapt algorithms to a new situation. Non-cognitive Skills <ul style="list-style-type: none"> • Attitude • Self-monitoring

4	<p>Contents:</p> <p><i>Contents of the course Statistical Signal Processing:</i> Statistical signal processing comprises the techniques that engineers and statisticians use to draw inference from imperfect and incomplete measurements. This course covers a selection of topics from the major domains of detection, estimation, and time series analysis. Topics that may be covered in this course include correlation analysis, linear minimum mean-squared error estimation, performance bounds for parameter estimation, Neyman-Pearson detectors, wide-sense stationary, nonstationary and cyclostationary time series, and complex-valued random signals.</p>										
5	<p>Learning outcomes and competences:</p> <p>After attending this course, students will be familiar with the basic principles of statistical signal processing. They will understand how to apply statistical signal processing techniques to relevant fields in electrical engineering (such as communications). Students will develop confidence in their ability to solve mathematical problems of analysis and design. They will be able to apply the principles they have learned in this course to other areas.</p> <p>Non-cognitive Skills</p> <ul style="list-style-type: none"> • Commitment • Cooperation • Learning competence

	<i>Contents of the course Strategische Produktplanung im Zeitalter der Digitalisierung:</i> In the age of digitalization, fascinating opportunities for new products and services are opening up more than ever before. The only question is, will these new products be successful in the market? The goal of the lecture is a comprehensive overview of methods and tools of strategic planning in the age of digitization. Students are taught the essential topics of strategic planning. This includes basics, methods and IT tools. The findings from the lecture will be explained and deepened in an accompanying exercise and case study. The lecture focuses on intelligent technical systems with a high proportion of software.

4	<p>Contents:</p> <p><i>Contents of the course Topics in Pattern Recognition and Machine Learning:</i></p> <p>The course on “Topics in Pattern Recognition and Machine Learning” first briefly summarizes the main concepts of statistical pattern recognition and machine learning. Next selected topics will be presented in detail. The choice of topics depends on current research activities and thus may change over time. Examples of such topics to be studied in detail include:</p> <ul style="list-style-type: none">• Model estimation in the presence of hidden variables, in order to reveal suspected latent structure buried in the data• Specific classification tasks, such as automatic speech recognition• Fundamentals of statistical pattern recognition: Bayes rule, learning of class-conditional densities, linear models for classification and regression• EM Algorithm and extensions thereof• Models with discrete or continuous latent variables; GMM, NMF• Bias-Variance dilemma and the tradeoff between degree of detail and generalizability of models• Graphical models• Sequential data and Hidden Markov models and their application in speech recognition• Recent publications in pattern recognition and machine learning <p>While the first part of the course will follow a regular lecture format, the second part will include active student participation. Students will be asked to read, analyze and present recently published papers from the pattern recognition and machine learning literature. This will often also include the implementation of proposed algorithms in Matlab.</p>
5	<p>Learning outcomes and competences:</p> <p>After completion of the module students will be able to</p> <ul style="list-style-type: none">• Choose an appropriate classifier for a given classification problem and be able to learn the parameters of the classifier from training data• Choose an appropriate regression method for function approximation and learn its parameters from training data• Search for latent variables and structure in given data• Make an informative choice for the model order to find a good compromise between degree of detail and generalizability• Comprehend and analyze recent publications from the field of pattern recognition and machine learning <p>Non-cognitive Skills</p> <ul style="list-style-type: none">• Commitment• Cooperation• Learning competence• Literacy (scientific)

Topics in Signal Processing

3 Wahlpflichtmodule

Module number:	Workload (h): 180	Credits: 6	Regular Cycle: winter term			
	Semester number:	Duration (in sem.): 1	Teaching Language: en			
1	Module structure:					
	Course	form of teaching	contact-time (h)	self-study (h)	status (C/CE)	group size (TN)
	a) L.048.92014 Topics in Signal Processing	L2 Ex2	60	120	CE	20
2	Options within the module: none					
3	Admission requirements: <i>Prerequisites of course Topics in Signal Processing:</i> Recommended Proficiencies Signal and system theory, at least a basic understanding of probability and linear algebra					
4	Contents: <i>Contents of the course Topics in Signal Processing:</i> This course covers a selection of current topics in signal processing. One part of this course will follow a regular lecture format, while the other part will require student participation. The course will first review relevant aspects of linear algebra and probability theory. Then students will learn how to read, analyze, and present recent papers from the signal processing literature.					
5	Learning outcomes and competences: In this course, students will familiarize themselves with some current research topics in signal processing. They will learn to read and understand scientific publications and to critically evaluate results. Non-cognitive Skills <ul style="list-style-type: none"> • Commitment • Cooperation • Learning competence • Literacy (scientific)

	Recommended Proficiencies					
	Knowledge in programming, IT security and basic knowledge in cryptography					

3 Wahlpflichtmodule

4	<p>Contents:</p> <p><i>Contents of the course Web Security:</i></p> <p>Modern web applications and web services usually consist of multiple layers. They are based on different (often complex) technologies that are constantly being developed. Their complexity is often the reason for new types of attacks that can be observed on the web every day.</p> <p>In this lecture, we will focus on the most important technologies and learn what you have to consider while securing your web applications. We will introduce prominent and widespread attacks and show how to prevent them. These range from typical attacks from the OWASP Top 10 list, such as XSS or SQL Injection, to attacks on web services and Single Sign-On standards (e.g., on SAML and OpenID Connect). Based on many cases, we will learn what is important in the design and implementation of secure web applications.</p>								
5	<p>Learning outcomes and competences:</p> <p>After successful completion, students have a comprehensive understanding of the technical aspects of web applications, web services, and various authentication mechanisms. They have learned that the web technologies used today are complex and that their complexity poses many security problems. Students have an overview of current web attacks and know how to prevent them practically.</p> <p>Non-cognitive Skills</p> <ul style="list-style-type: none"> • Team work • Literacy (scientific)

4 Focus Areas

4.1 Algorithm Design

Coordination

Prof. Dr. rer. nat. Johannes Blömer

Included Modules

- Advanced Algorithms
- Advanced Complexity Theory
- Advanced Distributed Algorithms and Data Structures
- Algorithms for Highly Complex Virtual Scenes
- Clustering Algorithms
- Combinatorial Optimization
- Efficiency in Games
- Foundations of Cryptography
- Game Theory
- Introduction to Quantum Computation
- Quantum Algorithms
- Quantum Complexity Theory
- Real World Crypto Engineering
- Routing and Data Management in Networks

Description

In this focus area students can concentrate on studying the

- important techniques for the design of efficient algorithms
- application areas for the design of efficient algorithms, i.e. computer graphics, networks, big data, ...
- limits for the design of efficient algorithms, i.e. complexity theory
- constructive use of complexity theory in cryptography and security
- connection between efficient algorithms and verification and software design

4.2 Computer Systems

Coordination

Prof. Dr. Marco Platzner

Included Modules

- Advanced Computer Architecture
- Algorithms for Synthesis and Optimization of Integrated Circuits
- Approximate Computing
- Architektur paralleler Rechnersysteme
- High-Performance Computing
- Reconfigurable Computing
- VLSI Testing

Description

The focus area “Computer systems” goes into technical depths of various aspects of modern computer systems. Main topics are the analysis and evaluation of computer architectures, systematic methods for design and optimisation of computer systems, in particular the interplay of hardware and software, and programming models and methods for parallel and specialised computer architectures, which are increasingly gaining importance.

4.3 Data Science

Coordination

Prof. Dr. Axel Ngonga

Included Modules

- Advanced Algorithms
- Advanced Distributed Algorithms and Data Structures
- Data Science for Physics and Engineering
- Data Science in Industrial Applications
- Digitale Sprachsignalverarbeitung
- Foundations of Knowledge Graphs
- High-Performance Computing
- Information Retrieval
- Machine Learning I
- Machine Learning II
- Statistical Natural Language Processing

4 Focus Areas

- Topics in Pattern Recognition and Machine Learning
- Topics in Signal Processing

Description

Data science is a young scientific discipline in the intersection of computer science, statistics, mathematics, and engineering, which has quickly developed into one of the most impactful areas in the current research landscape. It is a main driving factor of the digitalization and “datafication” of a large portion of our society, including companies, research organizations, and even private homes and people. In science and research, it is often viewed as a “fourth paradigm”, next to the empirical, theoretical, and computational approach. Broadly speaking, the major goal of data science is to develop methodological and algorithmic foundations as well as computer systems for automating the extraction of useful knowledge and insight from data.

The focus area “data science” will provide the students with solid theoretical foundations as well as practical skills that constitute the profile of a modern data scientist. To this end, courses will be offered in three main directions: Mathematical and algorithmic foundations, data analytics, software and systems. Here, the students will learn how to acquire, archive, compress, and aggregate large amounts of heterogeneous data (text, image, audio and video, etc.), and how to analyze such data using methods from statistics, machine learning, and data mining. Moreover, they will be familiarized with relevant programming languages, software engineering techniques, and scalable information processing architectures. Finally, the students will broaden their practical experience and develop soft skills by specializing in application areas such as Industrial Data Science, Digital Humanities, Business Analytics and Cybersecurity.

4.4 Intelligence and Data

Coordination

Prof. Dr. Axel Ngonga

Included Modules

- Clustering Algorithms
- Computational Argumentation
- Data Science for Physics and Engineering
- Foundations of Knowledge Graphs
- Information Retrieval
- Logic Programming for Artificial Intelligence
- Machine Learning I
- Machine Learning II
- Optimization Methods for Machine Learning
- Planning and Heuristic Search
- Statistical Natural Language Processing

- Statistical Signal Processing

Description

Intelligent systems are computer systems the behavior of which is controlled by methods and algorithms from artificial intelligence (AI). Systems of that kind are becoming increasingly important, not only on a scientific level but also in a social context: Autonomous or semi-autonomous systems such as service robots, self-driving cars or medical diagnosis systems will have a deep impact on our future private and professional life. In addition to methodological advances and improved hardware, the “data explosion” can be seen as a main driving factor for the rapid development of AI-systems during the last decade: Thanks to the availability of massive amounts of data or sensory feedback from their environment, intelligent systems are able to automatically improve their behavior through adaptation and learning.

This focus area covers important aspects of intelligent systems design and conveys corresponding theoretical and methodological foundations. This includes lectures on machine learning and data analysis, data management, computer graphical and visual data analysis, as well as swarm intelligence and robotics.

4.5 Networks and Communication

Coordination

Dr. rer. nat. Florian Klingler

Included Modules

- Advanced Distributed Algorithms and Data Structures
- Mobile Communication
- Networked Embedded Systems
- Routing and Data Management in Networks

Description

The focus area “Networks and Communication” teaches architectures, methods and systems of modern communication technology. To this end, we investigate methods of various abstractions levels, starting from the lowest level physical transmissions up to and including application design in distributed environments. Different types of systems are considered, ranging from conventional mobile communication over ad hoc networks and vehicular communication systems to networking in data centers and architectures for the future Internet at large. In doing so, we strive to build the bridge to aspects of distributed systems design. Questions on architecture design and options for protocol designs are complemented by the evaluation of such systems. To answer those questions, we introduce experimental and statistical performance evaluation techniques.

4.6 Security

Coordination

Prof. Dr. Eric Bodden

Included Modules

- Advanced Distributed Algorithms and Data Structures
- Designing code analyses for large-scale software systems 1
- Designing code analyses for large-scale software systems 2
- Foundations of Cryptography
- Introduction to Quantum Computation
- Quantum Complexity Theory
- Real World Crypto Engineering
- Selected Topics in Security
- Usable Security and Privacy
- Web Security

Description

In all areas of life, digital technologies, such as the (Industrial) Internet of Things, Cyber-Physical Systems, Digital Automotives, Digital Health or Industry 4.0, offer immense innovation potential. However, increasing digitization requires new approaches to safely exploit this potential. In order to be able to tackle this challenge, there is a great need in industry, research and teaching for well-trained computer science experts with in-depth knowledge of IT security. In the specialization area “IT Security”, solid theoretical basic knowledge is taught in combination with practical skills. The course covers technical skills from the field of IT security (e.g. software security, formal verification, basics of modern cryptography and communication security), in which typical security vulnerabilities and attack techniques are presented and countermeasures and their effectiveness are examined.

Since security cannot be seen independently of concrete applications and different applications have different security requirements, specialized competencies in modern application fields with special security requirements (e.g., communication protocols in the mobile and automotive fields) as well as supplementary qualifications in the areas of algorithms and quantum computing are also covered.

4.7 Software Engineering

Coordination

Prof. Dr. Eric Bodden

Included Modules

4 Focus Areas

- Build It, Break It, Fix It
- Data-Driven Innovation and Engineering
- Data Science in Industrial Applications
- Designing code analyses for large-scale software systems 1
- Designing code analyses for large-scale software systems 2
- High-Performance Computing
- Kontextuelle Informatik
- Logic Programming for Artificial Intelligence
- Model-Based Systems Engineering
- Selected Topics in Software Engineering
- Software Quality Assurance

Description

In this focus area, students can concentrate on studying concepts, languages, methods, techniques, and tools for the systematic development of software systems. These comprise

- constructive techniques for developing functional and non-functional aspects of a system,
- formal and informal analytical techniques to ensure high quality of a system,
- systematic techniques to enable situation-specific process models

5 Modules in Winter Semester

• M.079.4002 Advanced Algorithms	14
• M.079.4004 Advanced Complexity Theory	16
• M.079.4005 Advanced Computer Architecture	18
• M.079.4006 Advanced Distributed Algorithms and Data Structures	20
• M.079.4009 Algorithms for Highly Complex Virtual Scenes	22
